Keywords: Rural Health Services; Education, Medical

Implication for health policy/practice/research/medical education:
In developing countries, it would be beneficial to integrate the clinical training of the medical students’ education. It seems, given high volume of basic health services, at the simplest and most basic level of health systems in developing countries alongside the close contact with various diseases can provide a good opportunity to integrate students’ health education with clinical training in the field that benefits the development of medical education in the field.
